

IMPREGNATION LIQUID USER'S GUIDE

Surface has to be clean and dry. |

If we apply the impregnation liquid after the grouting is already done, make sure that the thin layer of grout is wiped off completely.

Try it on one tile before treating the whole surface. Apply the liquid evenly, using 10-15 cm wide teddy roll.

Use clean white linen for cleaning and wiping. Keep applying the liquid until it stays unabsorbed (so the tiles are „filled up”), wipe off the surplus after leaving it on the surface for 30 minutes.

Test the efficiency of the sealing by dropping water on the surface: if it is not absorbed, but stays on, like raindrops on a watercoat, that means that the tiles are sealed.

You may start the sealing with wax after the impregnation is already dry, which normally takes about 1 hour.

The surface can be walked 24-48 hrs after the waxing is finished.

0,5 liter is sufficient to seal 5-6 m² of cement tiles.

Store it in a cool place!
